            SUBUNIT: Homodimer. SIMILARITY: Belongs to the 6-phosphogluconate dehydrogenase
                                                                                                                                                                                                                                                                                                                                                    PROSITE; PS00461, 6PGD; 1.
Gluconate utilization; Oxidoreductase; Pentose shunt; NADP;
PATHWAY: Hexose monophosphate shunt.

```
Insect Mol. Biol. 1:213-222(1993).
-!- CATALYTIC ACTIVITY: 6-phospho-D-gluconate + NADP(+) = D-ribulose 5-phosphate + CO(2) + NADPH.
-!- PATHMAX: Haxces monophosphate shunt.
-!- PATHMAX: Belongs to the 6-phosphogluconate dehydrogenase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises the amino acid and coding sequences of human nucleic acid-associated proteins (NAAP). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of NAAP, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis or cancer); developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation); neurological disorders (e.g. Alboiner's 6 disease, parkinson's disease or epilepsy); and autoimmune/inflammatory disorders (e.g. Albs, allergies, asthma or Crohn's disease). The DNA sequences of the invention are useful for creating transgenic animals to model human disease. The present amino acid sequence represents a human nucleic acid-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is secreted protein, encoded by a polynucleotide of the invention. The DNA was isolated from a human adult ovary CDNA library, and is designated clone AQ73 3. The DNA sequences and encoded polypeptides can be used as Tutritional sources or supplements, or may exhibit e.g. cytokine and call proliferation/differentiation activity, human stimulating or suppressing activity, haematopoiesis regulating activity, receptor/ligand activity, anti-inflammatory activity, activity, call activity, chambin activity, chemostatic/chemokinetic activity, cadherin/tumour invasion suppressor activity, tissue growth activity, tumour inhibition activity or other activities
                                                                                                             New isolated polynucleotides - obtained from human adult testis, human adult ovary, human adult brain and human adult heart cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KPYHAHKEEMIKINKGKRFQQAVDAVEBFLRRAKGKDQTSSHNSSDDKNRNSSEERSRP

Human cDNA clones represented in AAF98174 - AAF98489 encode secreted proteins AAB90567 - AAB90750. The CDNA clones are isolated from various clisue types, and may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate protein expression. The CDNA proteins and call proliferation/differentiation activity and may also be cyckine and cell proliferation/differentiation activity and may also be involved in modulation of the immune system. The cDNA sequences proteins, their agonists and/or antagonists exhibit haematopoiesis cemperatic/demokinetic activity; activity; activity, haematopoiesis activity; ceceptor/ligand activity; anti-inflammatory activity, haematopoiesis activity; and-or tumour inhibition activity; and-or tumour suppressor activity; and/or tumour inhibition activity. Included in the invention are probes represented in AAF98490 can appear and activity activity activity and activity activity activity and activity activit

diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, and for treating cancers, rheumatoid arthritis Novel polypeptides and polynucleotides useful as diagnostic reagents to

Claim 11; SEQ ID NO 417; 687pp; English.

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and cDNA (AAS34057-AAS35050) and DNA conserved by the sequences encoding for these polypeptides. The sequences of the invention and/or prognosis of disorders involving neoplastic disease such as hyperproliferative consortant in the diagnosis, treatment, prevention and/or prognosis of disorders (e.g. leukaemia, bone cancer, bladder cancer, brain stem consortant inver cancer, childhood cerebellar astrocytoma, or Hoddkin's lymphoma). The sequences of the invention may also be useful for treating other disorders such as neural disorders, immune system clisorders, muscular disorders, reproductive disorders, immune system disorders, pulmonary disorders, reproductive disorders and renal clisorders. The polynuclectide sequences of the invention are also useful consorted therapy. AAUS1568-AAU21851 represent the novel human neoplastic disease associated polypeptides of the invention. Note: The sequence data obtained in electronic format directly from WIPO at

Sequence 550 AA;

The invention relates to one of 238 disclosed human neoplastic disease—
associated polypeptides encoded by 171 disclosed cDNA sequences
(including their domains, epitopes, full-length proteins, allelic variants
or species homologues). Also included are there encoding nucleic acids, a
recombinant vector comprising the nucleic acid, a recombinant host cell
comprising the nucleic acid (expressing the protein), an isolated
antibody that binds specifically to the isolated polypeptide, preventing,
condition or a susceptibility to a pathological condition in a subject,
in a biological assay, and the gene corresponding to the CDNA sequence.
Condition or a susceptibility to an entibodies are useful for
the polypeptides, polynuclectides and antibodies are useful for
ameliorating medical conditions such as hyperproliferative diseases or
ameliorating medical conditions such as hyperproliferative diseases
concerned. autoimmune disorders (e.g. diabetes, rheumatoid arthritis,
conficulating medical conditions such as hyperproliferative diseases
concerned. Lupus erythematosus, multiple sclerosis, autoimmune thyroiditis
or haemolytic anaemia), haematopoletic or haematologic disorders (e.g.
canaemia or thrombocytopaenia), allergic reactions including asthma or
eczema, inflammatory disorders (e.g. ischaemia-reperfusion injury,
                                                     New isolated human neoplastic disease-associated polypeptides and polymucleotides, useful for diagnosing, preventing, prognosticating or treating medical conditions such as cancer, AIDS, diabetes or Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SFFLGEVGNAAKWMLIVNWVQGSFWATIAEGLTLAQVTGQSQQTLLDILNQGQLASIFLD 480

The invention relates to human enzyme (ENZM) polypeptides and their corresponding polynucleotides. ENZM sequences are useful for preparing a composition for diagnosing or treating a disease or condition associated with decreased expression or overexpression of functional ENZM. The infectious disorders include immune disorders (anaemia, allergy or asthma), immune deficiencies (acquired immune deficiency syndrome; AIDS), immune deficiencies (addison's disease, diabetes or goitre), reproductive disorders (infertility or impotence), cardiovascular disorders (atherosclerosis or myocardial infarction), eye disorders and cell proliferative disorders (center).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 KPYHAHKEEMIKINKGKRFQQAVDAVEEFLRRAKGKDQTSSHNSSDDKNRRNSSEERSRP 120

The invention relates to novel isolated nucleic acid molecules (I) encoding human secreted proteins (II). (I) and (II) are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in the prevention, treatment and diagnosis of diseases associated with the prevention, treatment and diagnosis of diseases associated with sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may be in need of restorative therapy. (II) may also be used as antigens in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acids and polypeptides, useful for diagnosing, preventing or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 11; SEQ ID NO 507; 753pp; English.

Cagonists and antagonists) of the expression and activity of the secreted fagonists and antagonists of the expression and activity of the secreted proteins. The anti-(II) antibodies and antagonists may also be used to down regulate expression and activity of (II). The anti-(II) antibodies of any also be used as diagnostic agents for detecting the presence of (II) and samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The clisorders include for example: immune/autoimmune diseases (e.g. HIV) and multiple sclerosis), cancers and hyperproliferative disorders (e.g. and multiple sclerosis), cancers and hyperproliferative disorders (e.g. methanomas, neoplasms of the breast or liver, Sezary syndrome and Gaucher's disease, neurological diseases (e.g. Alzhelimer's disease, parkinson's disease and charcot-Marie-Tooth disease), cardio-/
cerebrovascular disorders (e.g. cardiac arrest, tachycardia, angina and thrombosis), infections caused by bacteria, viruses and fungi and ocular disorders (e.g. corneal infections). (I) and (II), agonists, antagonists and antibodies can also be used to promote wound healing, maintain organs before transplantation, and support cell culture of primary tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                   0

SCI INC HUMAN GENOME (HUMA-) SM Ruben Barash SC, Rosen CA,

WPI; 2001-465558/50. N-PSDB; AAS35012.

Novel polypeptides and polymucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, and for treating cancers, rheumatoid arthritis.

Claim 11; SEQ ID NO 540; 687pp; English.

The present invention relates to the isolation of novel human neoplastic disease associated polypeptides, and CDNA (AAS34767-AAS35050) and DNA

The invention relates to one of 238 disclosed human neoplastic disease-
associated polypeptides encoded by 171 disclosed CDNA sequences
c associated polypeptides encoded by 171 disclosed CDNA sequences
(including their domains, epitopes, full-length proteins, allella variants
cc fincluding their domains, ancluded are there encoding nucleic acids, a
crecombinant vector comprising the nucleic acid, a recombinant host cell
c recombinant vector comprising the nucleic acid, a recombinant host cell
c recombinant vector comprising the protein, an isolated
c cantibody that binds specifically to the isolated polypeptide, preventing,
c treating or a susceptibility to a pathological condition in a subject,
condition or a susceptibility to a pathological condition in a subject,
c in a biological assay, and the gene corresponding to the CDNA sequence.
c the polypeptides, polynucleotides and antibodies are useful for
c meliorating medical conditions such as hyperproliferative diseases or
c ameliorating medical conditions such as hyperproliferative diseases or
c ancer, autoimmune disorders (e.g. diabetes, rheumatoid arthritis,
c systemic lupus erythematosus, multiple scleroais, autoimmune thyroiditis
c or haemolytic anaemia), haematopoietic or haematologic disorders (e.g.
c anaemia or thrombocytopaenia), allergic reactions including asthma or
c czema, inflammatory disorders (e.g. ischaemia-reperfusion injury,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HAHKEEMIKINKGKRFQQAVDAVEEFLRRAKGKDQTSSHNSSDDKNRNSSEERSRPNSG 123

Human hepatoma-derived growth factor-2 (HDGF-2) (AAW09404) shows 23% identity and 61% similarity over a 201-amino acid stretch to human HDGF, a mitogen for fibroblasts. Its amino acid sequence was deduced from a CDNA clone (AAT47520) isolated from a human umbilital wein endothelial tissue cDNA library. Recombinant HDGF-2 can be produced in transformed host (e.g. B. coli, Sf9, COS) cells. It is useful in stimulating tissue repair and tissue growth and can also be used to produce antibodies and
                                                                                                                                                                                  DNA encoding human-derived growth factor polypeptide - useful to promote wound healing as result of burns or ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                     screen for antagonists that retard tumour growth and reduce scarring
                                                                                                                                                                                                                                     Claim 7; Fig 2; 54pp; English

(HUMA-) HUMAN GENOME SCI INC

Rosen CA; Kunsch CA,

WPI; 2003-447425/42. N-PSDB; ACA61586. Novel isolated human hepatoma-derived growth factor-2 polypeptide usefutor promoting healing in wounds, treating or prevention of Alzheimer's disease, stimulating chondrocyte growth, preventing skin aging, and preventing hair loss.

Claim 2; Fig 1; 21pp; English.

ô

disease conditions such as thromboate of the such actual due to various such as thromboate of disease conditions such as thromboate of cardiovascular conditions; stimulating mesodermal induction and limb cardiovascular conditions; stimulating mesodermal induction and limb conditions; burns, surgery, and ulcers; stimulating neuronal growth, and thus for treating or preventing neuronal damage occuring in certain centenconal disorders or neuronal disorders are useful for inhibiting the cell growth and therefore are useful for preventing abnormal cellular growth and proliferation e.g. in tumour formation or growth; preventing the cell stream of seases and preventing the proliferation of epithelial or neuron contains or growth there are useful for macrow. The antenders or neoplastic cells and proliferation e.g. in tumour formation or growth; preventing the cell are are neglial or preventing dispansed and preventing the proliferation of epithelial. lens cells after extracapsular cataract surgery; preventing restenosis after balloon angioplasty; and preventing inflammation and growth of scar tissue during wound healing. This is the amino acid sequence of human hepatoma-derived growth factor-2 (HDGF-2) The invention describes a polypeptide (I) having a deduced amino acid sequence of human hepatoma-derived growth factor-2 (HDGF-2) polypeptide sequence of 249 amino acids (82) as given in the specification, or its fragments, analogues or derivatives. (I) is useful for stimulating vascular endothelial cell growth, and thus is employed in treatment for stimulating re-vascularisation of ischaemic tissues due to various

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The prevention, creatment and diagnosis of diseases associated with inappropriate expression of secreted proteins. (I) and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. oplymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples, and so which patients may the production of antibodies and in assays to identify modulators of secreted acquaints) of the expression and activity of the secreted agonists and antagonists) of the expression and activity of the secreted con regulate expression and activity of (II). The anti-(II) antibodies may also be used as diagnostic agents for detecting the presence of (II) in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). The classification of unitable solarosis, infections, anaemia, rheumatoid arthritis and multiple solarosis, cancers and hyperproliferative disorders (e.g. melanomas, neoplasms of the breast or liver, Sezary syndrome and Gaucher's disease, neurological diseases (e.g. Alzheimer's disease, cerebrovascular disorders (e.g. cardiac arrest, tachycardia, angina and thrombosis), infections oaused by bacteria, viruses and fungia and culsorders (e.g. cardiac arrest, tachycardia, angina and thrombosis), infections caused by bacteria, viruses and fungia and culsorders (e.g. corneal infections) (I) and (III), agonists, antagonists and antibodies can also be used to promote wound healing, maintain organs before transplantation, and support cell culture of primary tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel isolated nucleic acid molecules (I) encoding human secreted proteins (II). (I) and (II) are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. (I) and (II) may be used in the prevention, treatment and diagnosis of diseases associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acids and polypeptides, useful for diagnosing, preventing or treating medical conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 11; SEQ ID NO 545; 753pp; English.
